

Global Digital ID Acceptance, Built on One Platform

Identity is going digital. Government mandates are leading the shift – eIDAS 2.0 requires EU member states to offer digital identity wallets, and a growing number of jurisdictions now issue mobile driver’s licenses (mDLs). At the same time, Apple and Google wallets give people a place to carry and present these credentials. Together, regulations and consumer wallets are accelerating an emerging shift and in some markets, digital IDs are already beginning to replace physical documents.

Jumio verifies digital credentials natively, alongside the physical documents you already support, through a single integration. Every credential runs through the same fraud detection and liveness defense, so you meet users wherever their identity lives without lowering the verification bar. And because Jumio handles the slow, country-by-country accreditation on your behalf, you can accept new credential types as they emerge, without the work that holds other providers back.

What Jumio Verifies

Mobile Driver's Licenses (mDLs)

Accept state- and country-issued mobile driver's licenses as adoption advances in the U.S. and beyond.

Government-Issued Digital IDs

Verify national eIDs and government-backed digital credentials across a growing list of global schemes.

Digital Wallet Credentials

Verify identity credentials presented from Apple Wallet, Google Wallet and other major wallets.

Physical Documents

Continue verifying 5,000+ physical ID types globally – digital ID is an extension, not a replacement.

Solution Highlights

Compliance-ready by design

Ready for eIDAS 2.0 and emerging digital ID mandates without rebuilding your verification stack

One platform, every credential

Accept digital IDs, mDLs and digital wallet credentials alongside 5,000+ physical document types, all backed by the same biometric authentication, liveness, historical signals, risk scoring and Identity Graph

No country-by-country accreditation

Jumio handles accreditation on your behalf, so your team never navigates it market by market

Minimal technical lift for existing customers

Jumio Platform customers switch on digital ID support with no new integration

One platform

Global digital ID support with identity intelligence, biometrics, liveness detection, fraud signals, and existing identity workflows through a single platform.

Accreditation, handled

The country-by-country accreditation is already done, so you add new digital IDs faster, skipping the slow, per-market onboarding that normally comes first.

Native, not bolted on

Digital IDs run inside your verification flow, not a separate check beside it, so every credential clears the same bar, with one consistent decision and one system to manage.

More than a credential check

Jumio enriches every verification with biometrics, historical signals and fraud intelligence to confirm the real person behind the credential.
